CHARACTER CHANGES FOR IBM

SELECTRIC TYPEWRITER ELEMENTS . . . . .

Camwil Inc. offers two methods for the modification of IBM Selectric elements:

1. Spot Changes - Recommended for a minimum quantity of changes and elements. This service is performed on an IBM element and consists of the installation of specific characters molded by Camwil to customer requirements. A metallic coating is applied by the Camwil Metahese process to form a tough, long wearing surface bond over the entire element. The replacement characters are guaranteed for the life of the element.
2. Molded Elements - Economically preferable for requirements involving numerous changes and/or large quantities of elements. New spheres are prepared with any required assortment of characters molded in. The elements are molded of a shatter-proof plastic and coated by the Metahese process to provide a durable, attractive finish.

Characters and elements produced by Camwil provide clear, accurate print and are guaranteed to give satisfactory service.
